We show that if $a(x)$ and $f(x)$ satisfy some suitable conditions, then the Dirichlet problem $-\Delta u+u=a(x)|u|^{p-2} u+f(x)$ in $\Omega$ has a solution that changes sign in $\Omega$, in addition to two positive solutions where $\Omega$ is an unbounded cylinder domain in $\mathbb{R}^{N}$.

## 1. Introduction

Throughout this paper, let $x=(y, z)$ be the generic point of $\mathbb{R}^{N}$ with $y \in \mathbb{R}^{m}, z \in \mathbb{R}^{n}$, where

$$
\begin{equation*}
N=m+n \geq 3, \quad m \geq 2, n \geq 1,2<p<\frac{2 N}{N-2} \tag{1.1}
\end{equation*}
$$

In this paper, we study the multiplicity results of both positive and nodal solutions for the nonhomogeneous elliptic problems

$$
\begin{equation*}
-\Delta u+u=a(x)|u|^{p-2} u+f(x) \text { in } \Omega, \quad u \in H_{0}^{1}(\Omega), \tag{1.2}
\end{equation*}
$$

where $0 \in \omega \subseteq \mathbb{R}^{m}$ is a bounded smooth domain, $\Omega=\omega \times \mathbb{R}^{n}$ is a smooth unbounded cylinder domain in $\mathbb{R}^{N}$.

It is assumed that $a(x)$ and $f(x)$ satisfy the following assumptions:
(a1) $a(x)$ is continuous and $a(x) \in(0,1]$ on $\bar{\Omega}$, and

$$
\begin{equation*}
\lim _{|z| \rightarrow \infty} a(x)=1 \quad \text { uniformly for } y \in \bar{\omega} \tag{1.3}
\end{equation*}
$$

(f1) $f(x) \geq 0, f(x) \not \equiv 0, f(x) \in H^{-1}(\Omega)$;
(f2) $\gamma_{f}>0$ in which we defined

$$
\begin{align*}
\gamma_{f}=\inf \{ & {\left[\frac{1}{p-1}\right]^{(p-1) /(p-2)}(p-2)\|u\|^{2(p-1) /(p-2)} }  \tag{1.4}\\
& \left.-\int_{\Omega} f u d x: \int_{\Omega} a(x)|u|^{p} d x=1\right\}
\end{align*}
$$

$(f 3)$ there exist positive constants $C_{0}, \epsilon_{0}, R_{0}$ such that

$$
\begin{equation*}
f(x) \leq C_{0} \exp \left(-\sqrt{1+\mu_{1}+\epsilon_{0}}|z|\right) \quad \text { for }|z| \geq R_{0}, \text { uniformly for } y \in \bar{\omega} \tag{1.5}
\end{equation*}
$$

where $\mu_{1}$ is the first positive eigenvalue of the Dirichlet problem $-\Delta$ in $\omega$.
For the homogeneous case, that is, $f(x) \equiv 0, \mathrm{Zhu}[1]$ has established the existence of a positive solution and a nodal solution of problem (1.2) in $H^{1}\left(\mathbb{R}^{N}\right)$ provided $a(x)$ satisfies $a(x) \geq 1$ in $\mathbb{R}^{N}$ and $a(x)-1 \geq C /|x|^{l}$ as $|x| \rightarrow \infty$ for some positive constants $C$ and $l$. More recently, Hsu [2] extended the results of $\mathrm{Zhu}[1]$ with $\mathbb{R}^{N}$ to an unbounded cylinder $\Omega$. Let us recall that, by a nodal solution we mean the solution of problem (1.2) with change of sign.

For the nonhomogeneous case $(f(x) \not \equiv 0)$, Adachi and Tanaka [3] have showed that problem (1.2) has at least four positive solutions in $H^{1}\left(\mathbb{R}^{N}\right)$ for $a(x)$ and $f(x)$ satisfy some suitable conditions, but we place particular emphasis on the existence of nodal solutions. More recently, Chen [4] considered the multiplicity results of both positive and nodal solutions of problem (1.2) in $H^{1}\left(\mathbb{R}^{N}\right)$. She has showed that problem (1.2) has at least two positive solutions and one nodal solution in $H^{1}\left(\mathbb{R}^{N}\right)$ when $a(x)$ and $f(x)$ satisfy some suitable assumptions.

In the present paper, motivated by [4] we extend and improve the paper by Chen [4]. We will deal with unbounded cylinder domains instead of the entire space and also obtain the same results as in [4]. Our arguments are similar to those in [5, 6], which are based on Ekeland's variational principle [7].

Now, we state our main results.
Theorem 1.1. Assume $(a 1),(f 1),(f 2)$ hold and $a(x)$ satisfies assumption ( $a 2$ ).
(a2) there exist positive constants $C, \delta_{0}, R$ such that

$$
\begin{equation*}
a(x) \geq 1-C \exp \left(-\sqrt{1+\mu_{1}+\delta_{0}}|z|\right) \quad \text { for }|z| \geq R, \quad \text { uniformly for } y \in \bar{\omega} \tag{1.6}
\end{equation*}
$$

Then problem (1.2) has at least two positive solutions $u_{0}$ and $u_{1}$ in $H_{0}^{1}(\Omega)$. Furthermore, $u_{0}$ and $u_{1}$ satisfy $0<u_{0}<u_{1}$, and $u_{0}$ is a local minimizer of I where I is the energy functional of problem (1.2).

Theorem 1.2. Assume $(a 1),(f 1),(f 2),(f 3)$ hold and $a(x)$ satisfies assumption (a3).
(a3) there exist positive constants $\bar{C}, \bar{R}$, and $\bar{\delta}_{0}<1+\mu_{1}$ such that

$$
\begin{equation*}
a(x) \geq 1+\bar{C} \exp \left(-\sqrt{1+\mu_{1}-\bar{\delta}_{0}}|z|\right) \quad \text { for }|z| \geq \bar{R}, \quad \text { uniformly for } y \in \bar{\omega} \tag{1.7}
\end{equation*}
$$

Then problem (1.2) has a nodal solution in $H_{0}^{1}(\Omega)$ in addition to two positive solutions $u_{0}$ and $u_{1}$.
For the case $\Omega=\mathbb{R}^{N}$, we also have obtained the same results as in Theorems 1.1 and 1.2.

Theorem 1.3. Assume $(a 1),(f 1),(f 2)$ hold and $a(x)$ satisfies assumption (a2).
(a2) there exist positive constants $C, \delta_{0}, R$ such that

$$
\begin{equation*}
a(x) \geq 1-C \exp \left(-\sqrt{1+\delta_{0}}|x|\right) \quad \text { for }|x| \geq R \tag{1.8}
\end{equation*}
$$

Then problem (1.2) has at least two positive solutions $u_{0}$ and $u_{1}$ in $H^{1}\left(\mathbb{R}^{N}\right)$. Furthermore, $u_{0}$ and $u_{1}$ satisfy $0<u_{0}<u_{1}$, and $u_{0}$ is a local minimizer of I where $I$ is the energy functional of problem (1.2).

Theorem 1.4. Assume $(a 1),(f 1),(f 2),(f 3)$ hold and $a(x)$ satisfies assumption (a3) below.
(a3) there exist positive constants $\bar{C}, \bar{R}$ and $\bar{\delta}_{0}<1$ such that

$$
\begin{equation*}
a(x) \geq 1+\bar{C} \exp \left(-\sqrt{1-\bar{\delta}_{0}}|x|\right) \quad \text { for }|x| \geq \bar{R} \tag{1.9}
\end{equation*}
$$

Then problem (1.2) has a nodal solution in $H^{1}\left(\mathbb{R}^{N}\right)$ in addition to two positive solutions $u_{0}$ and $u_{1}$.
Among the other interesting problems which are similar to problem (1.2), Bahri and Berestycki [8] and Struwe [9] have investigated the following equation:

$$
\begin{equation*}
-\Delta u=|u|^{p-2} u+f(x) \text { in } \Omega, \quad u \in H_{0}^{1}(\Omega) \tag{1.10}
\end{equation*}
$$

where $2<p<2 N /(N-2), f \in L^{2}(\Omega)$, and $\Omega$ is a bounded domain in $\mathbb{R}^{N}$. They found that (1.10) possesses infinitely many solutions. More recently, Tarantello [5] proved that if $p=$ $2 N /(N-2)$ is the critical Sobolev exponent and $f \in H^{-1}$ satisfying suitable conditions, then (1.10) admits two solutions. For the case when $\Omega$ is an unbounded domain, Cao and Zhou [10], Cîrstea and Rădulescu [11], and Ghergu and Rădulescu [12] have been investigated the analogue equation (1.10) involving a subcritical exponent in $\mathbb{R}^{N}$. Furthermore, Rădulescu and Smets [13] proved existence results for nonautonomous perturbations of critical singular elliptic boundary value problems on infinite cones.

This paper is organized as follows. In Section 2, we give some notations and preliminary results. In Section 3, we will prove Theorem 1.1. In Section 4, we establish the existence of nodal solutions.

## 2. Preliminaries

In this paper, we always assume that $\Omega$ is an unbounded cylinder domain or $\mathbb{R}^{N}(N \geq 3)$. Let $\Omega_{R}=\{x \in \Omega:|z|<R\}$ for $R>0$, and let $\phi$ be the first positive eigenfunction of the Dirichlet problem $-\Delta$ in $\omega$ with eigenvalue $\mu_{1}$, unless otherwise specified. We denote by $C$ and $C_{i}$ ( $i=1,2, \ldots$ ) universal constants, maybe the constants here should be allowed to depend on $N$ and $p$, unless some statement is given. Now we begin our discussion by giving some definitions and some known results.

We define

$$
\begin{gather*}
\|u\|=\left(\int_{\Omega}\left(|\nabla u|^{2}+u^{2}\right) d x\right)^{1 / 2}, \\
\|u\|_{q}=\left(\int_{\Omega}|u|^{q} d x\right)^{1 / q}, \quad 1 \leq q<\infty,  \tag{2.1}\\
\|u\|_{\infty}=\sup _{x \in \Omega}|u(x)| .
\end{gather*}
$$

Let $H_{0}^{1}(\Omega)$ be the Sobolev space of the completion of $C_{0}^{\infty}(\Omega)$ under the norm $\|\cdot\|$ with the dual space $H^{-1}(\Omega), H^{1}\left(\mathbb{R}^{N}\right)=H_{0}^{1}\left(\mathbb{R}^{N}\right)$ and denote $\langle\cdot, \cdot\rangle$ the usual scalar product in $H_{0}^{1}(\Omega)$. The energy functional of problem (1.2) is given by

$$
\begin{equation*}
I(u)=\frac{1}{2} \int\left(|\nabla u|^{2}+u^{2}\right)-\frac{1}{p} \int a(x)|u|^{p}-\int f u \tag{2.2}
\end{equation*}
$$

here and from now on, we omit " $d x$ " and " $\Omega$ " in all the integration if there is no other indication. It is well known that $I$ is of $C^{1}$ in $H_{0}^{1}(\Omega)$ and the solutions of problem (1.2) are the critical points of the energy functional $I$ (see Rabinowitz [14]).

As the energy functional $I$ is not bounded on $H_{0}^{1}(\Omega)$, it is useful to consider the functional on the Nehari manifold

$$
\begin{equation*}
N=\left\{u \in H_{0}^{1}(\Omega) \backslash\{0\}:\left\langle I^{\prime}(u), u\right\rangle=0\right\} . \tag{2.3}
\end{equation*}
$$

Thus, $u \in \Omega$ if and only if

$$
\begin{equation*}
\left\langle I^{\prime}(u), u\right\rangle=\|u\|^{2}-\int a(x)|u|^{p}-\int f u=0 \tag{2.4}
\end{equation*}
$$

Easy computation shows that $I$ is bounded from below in the set $\Omega$. Note that $\Omega$ contains every nonzero solution of (1.2).

Similarly to the method used in Tarantello [5], we split $\mathcal{N}$ into three parts:

$$
\begin{align*}
& \mathcal{N}^{+}=\left\{u \in \mathcal{N}:\|u\|^{2}-(p-1) \int a(x)|u|^{p}>0\right\}, \\
& \mathcal{N}^{0}=\left\{u \in \Omega:\|u\|^{2}-(p-1) \int a(x)|u|^{p}=0\right\},  \tag{2.5}\\
& \mathcal{N}^{-}=\left\{u \in \Omega:\|u\|^{2}-(p-1) \int a(x)|u|^{p}<0\right\} .
\end{align*}
$$

Let us introduce the problem at infinity associated with problem (1.2) as

$$
\begin{equation*}
-\Delta u+u=|u|^{p-2} u \text { in } \Omega, \quad u \in H_{0}^{1}(\Omega), u>0 \text { in } \Omega . \tag{2.6}
\end{equation*}
$$

We state here some known results for problem (2.6). First of all, we recall that by Esteban [15] and Lien et al. [16], problem (2.6) has a ground state solution $w$ such that

$$
\begin{equation*}
S^{\infty}=I^{\infty}(w)=\sup _{t \geq 0} I^{\infty}(t w)=\left(\frac{1}{2}-\frac{1}{p}\right) S^{p /(p-2)} \tag{2.7}
\end{equation*}
$$

where $I^{\infty}(u)=(1 / 2)\|u\|^{2}-(1 / p) \int|u|^{p}, S^{\infty}=\inf \left\{I^{\infty}(u): u \in H_{0}^{1}(\Omega), u \neq 0,\left(I^{\infty}\right)^{\prime}(u)=0\right\}$ and

$$
\begin{equation*}
S=\inf \left\{\int\left(|\nabla u|^{2}+u^{2}\right): u \in H_{0}^{1}(\Omega), \int|u|^{p}=1\right\} \tag{2.8}
\end{equation*}
$$

Furthermore, from Hsu [2] we can deduce that for any $\epsilon \in\left(0,1+\mu_{1}\right)$ there exist positive constants $C_{\epsilon}, \widetilde{C_{\epsilon}}$ such that, for all $x=(y, z) \in \Omega$,

$$
\begin{equation*}
\widetilde{C_{\epsilon}} \phi(y) \exp \left(-\sqrt{1+\mu_{1}+\epsilon}|z|\right) \leq w(x) \leq C_{\epsilon} \phi(y) \exp \left(-\sqrt{1+\mu_{1}-\epsilon}|z|\right) \tag{2.9}
\end{equation*}
$$

We also quote the following lemma (see Hsu [17] or K.-J. Chen et al. [18] for the proof) about the decay of positive solution of problem (1.2) which we will use later.

Lemma 2.1. Assume $(a 1),(f 1)$ and $(f 3)$ hold. If $u \in H_{0}^{1}(\Omega)$ is a positive solution of problem (1.2), then
(i) $u \in L^{q}(\Omega)$ for all $q \in[2, \infty)$;
(ii) $u(y, z) \rightarrow 0$ as $|z| \rightarrow 0$ uniformly for $y \in \omega$ and $u \in C^{1, \alpha}(\bar{\Omega})$ for any $0<\alpha<1$;
(iii) for any $\epsilon \in\left(0,1+\mu_{1}\right)$, there exist positive constants $c_{\epsilon}, \widetilde{c_{\epsilon}}$ such that, for all $x=(y, z) \in \Omega$,

$$
\begin{equation*}
\tilde{c}_{\epsilon} \phi(y) \exp \left(-\sqrt{1+\mu_{1}+\epsilon}|z|\right) \leq u(x) \leq c_{\epsilon} \phi(y) \exp \left(-\sqrt{1+\mu_{1}+\epsilon}|z|\right) \tag{2.10}
\end{equation*}
$$

We end this preliminaries by the following definition.

Definition 2.2. Let $c \in \mathbb{R}, E$ be a Banach space and $I \in C^{1}(E, \mathbb{R})$.
(i) $\left\{u_{n}\right\}$ is a $(P S)_{c}$-sequence in $E$ for $I$ if $I\left(u_{n}\right)=c+o(1)$ and $I^{\prime}\left(u_{n}\right)=o(1)$ strongly in $E^{-1}$ as $n \rightarrow \infty$.
(ii) We say that $I$ satisfies the $(P S)_{c}$ condition if any $(P S)_{c}$-sequence $\left\{u_{n}\right\}$ in $E$ for $I$ has a convergent subsequence.

## 3. Proof of Theorem 1.1

In this section, we will establish the existence of two positive solutions of problem (1.2).
First, we quote some lemmas for later use (see the proof of Tarantello [5] or Chen [4, Lemmas 2.2, 2.3, and 2.4]).

Lemma 3.1. Assume (a1) and $(f 1)$ hold, then for every $u \in H_{0}^{1}(\Omega), u \neq 0$, there exists a unique $t^{-}=t^{-}(u)>0$ such that $t^{-} u \in \mathcal{N}^{-}$. In particular, we have

$$
\begin{equation*}
t^{-}>\left(\frac{\|u\|^{2}}{(p-1) \int a(x)|u|^{p}}\right)^{1 /(p-2)}=t_{\max } \tag{3.1}
\end{equation*}
$$

and $I\left(t^{-} u\right)=\max _{t \geq t_{\max }} I(t u)$. Moreover, if $\int f u>0$, then there exists a unique $t^{+}=t^{+}(u)>0$ such that $t^{+} u \in \mathcal{N}^{+}$. In particular,

$$
\begin{equation*}
t^{+}<t_{\max } \tag{3.2}
\end{equation*}
$$

$I\left(t^{+} u\right)=\min _{0 \leq t \leq t_{\max }} I(t u)$ and $I\left(t^{-} u\right)=\max _{t \geq 0} I(t u)$.
Lemma 3.2. Assume (a1), (f1) and (f2) hold, then for every $u \in \mathcal{N} \backslash\{0\}$, we have

$$
\begin{equation*}
\left.\|u\|^{2}-(p-1) \int a(x)|u|^{p} \neq 0 \quad \text { (i.e., } \mathcal{N}_{0}=\{0\}\right) \tag{3.3}
\end{equation*}
$$

Lemma 3.3. Assume (a1), (f1) and (f2) hold, then for every $u \in \mathcal{N} \backslash\{0\}$, there exist $a \in>0$ and $a$ $C^{1}$-map $t=t(w)>0, w \in H_{0}^{1}(\Omega),\|w\|<\epsilon$ satisfying that

$$
\begin{align*}
t(0) & =1, \quad t(w)(u-w) \in \mathcal{N}, \quad \text { for }\|w\|<\epsilon \\
\left\langle t^{\prime}(0), w\right\rangle & =\frac{2 \int(\nabla u \nabla w+u w)-p \int a(x)|u|^{p-2} u w-\int f w}{\|u\|^{2}-(p-1) \int a(x)|u|^{p}} . \tag{3.4}
\end{align*}
$$

Apply Lemmas 3.1, 3.2,3.3, and Ekeland variational principle [7], and we can establish the existence of the first positive solution.

Proposition 3.4. Assume $(a 1),(f 1)$ and $(f 2)$ hold, then the minimization problem $c_{0}=\inf _{\mathcal{N}} I=$ $\inf _{\mathcal{N}^{+}} I$ is achieved at a point $u_{0} \in \mathcal{N}^{+}$which is a critical point for $I$. Moreover, if $f(x) \geq 0$ and $f(x) \not \equiv 0$, then $u_{0}$ is a positive solution of problem (1.2) and $u_{0}$ is a local minimizer of $I$.

Proof. Modifying the proof of Chen [4, Proposition 2.5]. Here we omit it.
Since $u_{0} \in \mathcal{N}^{+}$and $c_{0}=\inf _{\mathcal{N}} I=\inf _{\mathcal{N}^{+}} I$, thus, in the search of our second positive solution, it is natural to consider the second minimization problem:

$$
\begin{equation*}
c_{1}=\inf _{\mathcal{N}^{-}} I . \tag{3.5}
\end{equation*}
$$

We will establish the existence of the second positive solution of problem (1.2) by proving that $I$ satisfies the $(P S)_{c_{1}}$-condition.

Proposition 3.5. Assume $(a 1),(f 1)$ and $(f 2)$ hold, then I satisfies the $(P S)_{c}$-condition with $c \in$ $\left(-\infty, c_{0}+S^{\infty}\right)$.

Proof. Let $\left\{u_{n}\right\}$ be a $(P S)_{c}$-sequence for $I$ with $c \in\left(-\infty, c_{0}+S^{\infty}\right)$. It is easy to see that $\left\{u_{n}\right\}$ is bounded in $H_{0}^{1}(\Omega)$, so we can find a $\bar{u} \in H_{0}^{1}(\Omega)$ such that $u_{n} \rightharpoonup \bar{u}$ weakly in $H_{0}^{1}(\Omega)$ up to a subsequence and $\bar{u}$ is a critical point of $I$. Furthermore, we may assume $u_{n} \rightarrow \bar{u}$ a.e. in $\Omega$, $u_{n} \rightarrow \bar{u}$ strongly in $L_{\mathrm{loc}}^{s}(\Omega)$ for all $1 \leq s<2 N /(N-2)$. Hence we have that $I^{\prime}(\bar{u})=0$ and

$$
\begin{equation*}
\int f u_{n}=\int f \bar{u}+o(1) \tag{3.6}
\end{equation*}
$$

Set $v_{n}=u_{n}-\bar{u}$. Then by (3.6) and Brézis and Lieb lemma (see [19]), we obtain

$$
\begin{align*}
I\left(u_{n}\right) & =\frac{1}{2}\left\|u_{n}\right\|^{2}-\frac{1}{p} \int a(x)\left|u_{n}\right|^{p}-\int f u_{n}  \tag{3.7}\\
& =I(\bar{u})+\frac{1}{2}\left\|v_{n}\right\|^{2}-\frac{1}{p} \int a(x)\left|v_{n}\right|^{p}+o(1)
\end{align*}
$$

Moreover, by Vitali's lemma and $I^{\prime}(\bar{u})=0$,

$$
\begin{align*}
o(1) & =\left\langle I^{\prime}\left(u_{n}\right), u_{n}\right\rangle \\
& =\|\bar{u}\|^{2}-\int a(x)|\bar{u}|^{p}-\int f \bar{u}+\left\|v_{n}\right\|^{2}-\int a(x)\left|v_{n}\right|^{p}+o(1) \\
& =\left\langle I^{\prime}(\bar{u}), \bar{u}\right\rangle+\left\|v_{n}\right\|^{2}-\int a(x)\left|v_{n}\right|^{p}+o(1)  \tag{3.8}\\
& =\left\|v_{n}\right\|^{2}-\int a(x)\left|v_{n}\right|^{p}+o(1)
\end{align*}
$$

In view of assumptions $I\left(u_{n}\right)=c+o(1)$, and (3.7), (3.8), $\bar{u} \in \mathcal{N}$ and by Lemma 3.2, we obtain

$$
\begin{gather*}
c \geq c_{0}+\frac{1}{2}\left\|v_{n}\right\|^{2}-\frac{1}{p} \int a(x)\left|v_{n}\right|^{p}+o(1)  \tag{3.9}\\
\left\|v_{n}\right\|^{2}-\int a(x)\left|v_{n}\right|^{p}=o(1) \tag{3.10}
\end{gather*}
$$

Hence, we may assume that

$$
\begin{equation*}
\left\|v_{n}\right\|^{2} \longrightarrow b, \quad \int a(x)\left|v_{n}\right|^{p} \longrightarrow b \tag{3.11}
\end{equation*}
$$

By the definition of $S$, we have $\left\|v_{n}\right\|^{2} \geq S\left\|v_{n}\right\|_{p}^{2}$, combining with (3.11) and $\|a\|_{\infty}=1$, and we get that $b \geq S b^{2 / p}$. Either $b=0$ or $b \geq S^{p /(p-2)}$. If $b=0$, the proof is complete. Assume that $b \geq S^{p /(p-2)}$, from (2.7), (3.9), and (3.11), we get

$$
\begin{equation*}
c \geq c_{0}+\left(\frac{1}{2}-\frac{1}{p}\right) b \geq c_{0}+\left(\frac{1}{2}-\frac{1}{p}\right) S^{p /(p-2)} \geq c_{0}+S^{\infty} \tag{3.12}
\end{equation*}
$$

which is a contradiction. Therefore, $b=0$ and we conclude that $u_{n} \rightarrow \bar{u}$ strongly in $H_{0}^{1}(\Omega)$.

Let $e_{N}=(0,0, \ldots, 0,1) \in \mathbb{R}^{N}$, let $e_{n}=(0,0, \ldots, 0,1) \in \mathbb{R}^{n}$, and let $k>0$ be a constant, we denote $w_{k}(x)=w\left(x-k e_{N}\right)$ and $u_{k}(x)=u_{0}\left(x+k e_{N}\right)$ for $x \in \Omega$ where $w$ is the ground state solution of problem (2.6) and $u_{0}$ is the first positive solution of problem (1.2).

Proposition 3.6. Assume (a1),(a2) and ( $f 1$ ) hold, then there exists $k_{0} \geq 1$ such that

$$
\begin{equation*}
I\left(u_{0}+t w_{k_{0}}\right)<c_{0}+S^{\infty}, \quad \forall t>0 \tag{3.13}
\end{equation*}
$$

The following estimates are important to find a path which lies below the first level of the break down of the $(P S)_{c}$ condition. Here we use an interaction phenomenon between $u_{0}$ and $w_{k_{0}}$.

To give a proof of Proposition 3.6, we need to establish some lemmas.
Lemma 3.7. Let $B_{1}=\left\{x=(y, z) \in \Omega: y \in \omega_{0},|z| \leq 1\right\}$, and $\omega_{0} \subset \subset \omega$ is a domain in $\mathbb{R}^{m}$. Then for any $\epsilon \in\left(0,1+\mu_{1}\right)$, there exists a positive constant $C_{1}(\epsilon)$ such that

$$
\begin{equation*}
\int_{B_{1}} u_{k}(x) \geq C_{1} e^{-\sqrt{1+\mu_{1}+\epsilon} k}, \quad \forall k \geq 1 \tag{3.14}
\end{equation*}
$$

Proof. From (2.10), we have for $k \geq 1$,

$$
\begin{aligned}
\int_{B_{1}} u_{k}(x) & =\int_{B_{1}} u\left(x+k e_{N}\right) \\
& \geq \int_{B_{1}} \widetilde{c_{\epsilon}} \phi(y) e^{-\sqrt{1+\mu_{1}+\epsilon}\left|z+k e_{N}\right|} \\
& \geq \tilde{c_{\epsilon}} e^{-\sqrt{1+\mu_{1}+\epsilon}(k+1)} \int_{B_{1}} \phi(y) \\
& \geq C_{1} e^{-\sqrt{1+\mu_{1}+\epsilon} k}
\end{aligned}
$$

Lemma 3.8. Let $\Theta$ be a domain in $\mathbb{R}^{n}$, and let $z=\left(z_{1}, z_{2}, \ldots, z_{n}\right)$ be a vector in $\mathbb{R}^{n}$. If $g: \Theta \rightarrow \mathbb{R}$ satisfies

$$
\begin{equation*}
\int_{\Theta}\left|g(z) e^{\sigma|z|}\right| d z<\infty \text { for some } \sigma>0 \tag{3.16}
\end{equation*}
$$

then

$$
\begin{equation*}
\left(\int_{\Theta} g(z) e^{-\sigma\left|z+k e_{n}\right|} d z\right) e^{\sigma k}=\int_{\Theta} g(z) e^{-\sigma z_{n}} d z+o(1) \quad \text { as } k \longrightarrow \infty, \tag{3.17}
\end{equation*}
$$

or

$$
\begin{equation*}
\left(\int_{\Theta} g(z) e^{-\sigma\left|z-k e_{n}\right|} d z\right) e^{\sigma k}=\int_{\Theta} g(z) e^{\sigma z_{n}} d z+o(1) \quad \text { as } k \longrightarrow \infty \tag{3.18}
\end{equation*}
$$

Proof. We know $\sigma\left|k e_{n}\right| \leq \sigma|z|+\sigma\left|z+k e_{n}\right|$, then

$$
\begin{equation*}
\left|g(z) e^{-\sigma\left|z+k e_{n}\right|} e^{\sigma\left|k e_{n}\right|}\right| \leq\left|g(z) e^{\sigma|z|}\right| \tag{3.19}
\end{equation*}
$$

Since $-\sigma\left|z+k e_{n}\right|+\sigma\left|k e_{n}\right|=-\sigma\left(\left\langle z, k e_{n}\right\rangle /\left|k e_{n}\right|\right)+o(1)=-\sigma z_{n}+o(1)$ as $k \rightarrow \infty$, the lemma follows from the Lebesgue's dominated convergence theorem.

Now, we give the proof of Proposition 3.6.

The Proof of Proposition 3.6
Recall $B_{1}=\left\{x=(y, z) \in \Omega\left|y \in \omega_{0},|z| \leq 1\right\}\right.$, where $\omega_{0} \subset \subset \omega$ is a domain in $\mathbb{R}^{m}$. For $k \geq 1$, let

$$
\begin{align*}
& D_{k}=\left\{x \in \Omega: x-k e_{N} \in B_{1}\right\}, \\
& r=\min _{x \in D_{k}} w_{k}(x)=\min _{x \in B_{1}} w(x)>0 . \tag{3.20}
\end{align*}
$$

We also remark that for all $s>0, t>0$,

$$
\begin{equation*}
(s+t)^{p}-s^{p}-t^{p}-p s^{p-1} t \geq 0 \tag{3.21}
\end{equation*}
$$

and for any $s_{0}>0$ and $r_{0}>0$ there exists $C_{2}\left(s_{0}, r_{0}\right)>0$ such that for all $s \in\left[0, r_{0}\right], t \in\left[s_{0}, r_{0}\right]$,

$$
\begin{equation*}
(s+t)^{p}-s^{p}-t^{p}-p s^{p-1} t \geq C_{2}\left(s_{0}, r_{0}\right) s t \tag{3.22}
\end{equation*}
$$

Since $I$ is continuous in $H_{0}^{1}(\Omega)$, there exists $t_{1}>0$ such that for all $t \in\left[0, t_{1}\right]$,

$$
\begin{equation*}
I\left(u_{0}+t w_{k}\right)<I\left(u_{0}\right)+I^{\infty}(w), \quad \forall k \geq 0 \tag{3.23}
\end{equation*}
$$

and by the fact that $I\left(u_{0}+t w_{k}\right) \rightarrow-\infty$ as $t \rightarrow \infty$ uniformly in $k \geq 1$, then there exists $t_{0}>0$ such that

$$
\begin{equation*}
\sup _{t \geq 0} I\left(u_{0}+t w_{k}\right)=\sup _{0 \leq t \leq t_{0}} I\left(u_{0}+t w_{k}\right) \tag{3.24}
\end{equation*}
$$

Thus, we only need to show that there exists a constant $k_{0} \geq 1$ such that

$$
\begin{equation*}
\sup _{\mathrm{t}_{1} \leq t \leq t_{0}} I\left(u_{0}+t w_{k}\right)<I\left(u_{0}\right)+I^{\infty}(w), \quad \forall k \geq k_{0} \tag{3.25}
\end{equation*}
$$

Straightforward computation gives us

$$
\begin{align*}
I\left(u_{0}+t w_{k}\right)= & \frac{t^{2}}{2}\left\|u_{0}\right\|^{2}+\frac{t^{2}}{2}\left\|w_{k}\right\|^{2}+\left\langle u_{0}, t w_{k}\right\rangle-\frac{1}{p} \int a(x)\left|u_{0}+t w_{k}\right|^{p} \\
& -\int f u_{0}-t \int f w_{k} \\
= & I\left(u_{0}\right)+I^{\infty}\left(t w_{k}\right) \\
& -\frac{1}{p} \int\left(a(x)\left|u_{0}+t w_{k}\right|^{p}-a(x)\left|u_{0}\right|^{p}-a^{\infty}\left|t w_{k}\right|^{p}\right)+t \int a(x)\left|u_{0}\right|^{p-1} w_{k}  \tag{3.26}\\
= & I\left(u_{0}\right)+I^{\infty}(t w) \\
& -\frac{1}{p} \int a(x)\left(\left|u_{0}+t w_{k}\right|^{p}-\left|u_{0}\right|^{p}-\left|t w_{k}\right|^{p}-p\left|u_{0}\right|^{p-1} t w_{k}\right) \\
& +\frac{1}{p} \int\left(a^{\infty}\left|t w_{k}\right|^{p}-a(x)\left|t w_{k}\right|^{p}\right) \\
\leq & c_{0}+S^{\infty}-(I)+(I I)
\end{align*}
$$

where

$$
\begin{gather*}
(I)=\frac{1}{p} \int a(x)\left(\left|u_{0}+t w_{k}\right|^{p}-\left|u_{0}\right|^{p}-\left|t w_{k}\right|^{p}-p\left|u_{0}\right|^{p-1} t w_{k}\right) \\
(I I)=\frac{1}{p} \int\left(a^{\infty}-a(x)\right)\left|t w_{k}\right|^{p} . \tag{3.27}
\end{gather*}
$$

Thus, we only need to prove that there exists a constant $k_{0} \geq 1$ such that

$$
\begin{equation*}
-(I)+(I I)<0, \quad \forall t \in\left[t_{1}, t_{0}\right] \tag{3.28}
\end{equation*}
$$

Now we estimate $(I)$ and $(I I)$. Without loss of generality, we may assume that $\delta_{0}<\left(p^{2}-\right.$ 1) $\left(1+\mu_{1}\right)$. Thus, we can choose $\tilde{\epsilon}_{0}$ small enough such that

$$
\begin{equation*}
p \sqrt{1+\mu_{1}-\tilde{\epsilon}_{0}}>\sqrt{1+\mu_{1}+\delta_{0}} \tag{3.29}
\end{equation*}
$$

By (3.21),

$$
\begin{align*}
(I) & =\frac{1}{p} \int a(x)\left(\left|u_{0}+t w_{k}\right|^{p}-\left|u_{0}\right|^{p}-\left|t w_{k}\right|^{p}-p\left|u_{0}\right|^{p-1} t w_{k}\right) \\
& \geq \frac{1}{p} \int_{D_{k}} a(x)\left(\left|u_{0}+t w_{k}\right|^{p}-\left|u_{0}\right|^{p}-\left|t w_{k}\right|^{p}-p\left|u_{0}\right|^{p-1} t w_{k}\right) . \tag{3.30}
\end{align*}
$$

Let $a_{0}=\inf _{x \in \Omega} a(x)>0, s_{0}=t_{1} \min _{x \in D_{k}} w_{k}(x), r_{0}=\max \left\{\max _{x \in \Omega} u_{0}(x), t_{0} \max _{x \in \Omega} w(x)\right\}>0$ and by applying (3.22), we obtain

$$
\begin{align*}
(I) & \geq \frac{a_{0}}{p} \int_{D_{k}} C_{2}\left(s_{0}, r_{0}\right) t u_{0} w_{k} \\
& \geq \frac{a_{0}}{p} C_{2}\left(s_{0}, r_{0}\right) t_{1} \int_{x \in B_{1}} u_{k} w \quad \forall t \in\left[t_{1}, t_{0}\right] . \tag{3.31}
\end{align*}
$$

Let $\epsilon=\delta_{0} / 2$. Then applying (3.14), we have for $A=\left(a_{0} / p\right) C_{1}\left(\delta_{0} / 2\right) C_{2}\left(s_{0}, r_{0}\right) t_{1}\left(\min _{x \in B_{1}} w(x)\right)$

$$
\begin{equation*}
(I) \geq A e^{-\sqrt{1+\mu_{1}+\left(\delta_{0} / 2\right)} k} \tag{3.32}
\end{equation*}
$$

Next from (a2), (2.9), (3.29), and Lemma 3.8, there exists a $k_{1}$ such that for any $k \geq k_{1}$,

$$
\begin{aligned}
(I I)= & \frac{1}{p} \int\left(a^{\infty}-a(x)\right)\left|t w_{k}\right|^{p} \\
= & \frac{1}{p} \int_{\Omega_{R}}\left(a^{\infty}-a(x)\right)\left|t w_{k}\right|^{p}+\frac{1}{p} \int_{\Omega \backslash \Omega_{R}}\left(a^{\infty}-a(x)\right)\left|t w_{k}\right|^{p} \\
\leq & \frac{t_{0}^{p}}{p}\left(a^{\infty}+\|a\|_{\infty}\right) \int_{\Omega_{R}} C_{\tilde{\epsilon}_{0}}^{p} \phi^{p}(y) e^{-p \sqrt{1+\mu_{1}-\tilde{\epsilon}_{0}}\left|z-k e_{n}\right|} \\
& +\frac{t_{0}^{p}}{p} \int_{\Omega \backslash \Omega_{R}} C C_{\tilde{\epsilon}_{0}}^{p} \phi^{p}(y) e^{-\sqrt{1+\mu_{1}+\delta_{0}}|z|} e^{-p \sqrt{1+\mu_{1}-\tilde{\epsilon}_{0}}\left|z-k e_{n}\right|} \\
\leq & C_{3} e^{-p \sqrt{1+\mu_{1}-\tilde{\epsilon}_{0}} k}+\frac{t_{0}^{p}}{p} C C_{\tilde{\epsilon}_{0}}^{p} \int_{\omega} \phi^{p}(y) d y \int_{\mathbb{R}^{n}} e^{-\sqrt{1+\mu_{1}+\delta_{0}}\left|z+k e_{n}\right|} e^{-p \sqrt{1+\mu_{1}-\tilde{\epsilon}_{0}}|z|} d z \\
\leq & C_{3} e^{-p \sqrt{1+\mu_{1}-\widetilde{\epsilon}_{0}} k}+C_{4} e^{-\sqrt{1+\mu_{1}+\delta_{0}} k} .
\end{aligned}
$$

From (3.29), we have for $B=2 \max \left\{C_{3}, C_{4}\right\}$,

$$
\begin{equation*}
(I I) \leq B e^{-\sqrt{1+\mu_{1}+\delta_{0}} k} \tag{3.34}
\end{equation*}
$$

Finally, we can choose $k_{0} \geq k_{1}$ large enough such that

$$
\begin{equation*}
B e^{-\sqrt{1+\mu_{1}+\delta_{0}} k}<A e^{-\sqrt{1+\mu_{1}+\left(\delta_{0} / 2\right)} k}, \quad \forall k \geq k_{0} \tag{3.35}
\end{equation*}
$$

Thus from (3.26) and (3.32)-(3.35), we obtain (3.13). This completes the proof of Proposition 3.6.

Proposition 3.9. For $c_{1}=\inf _{\mathcal{N}^{-}}$I, there exists a $(P S)_{c_{1}}$-sequence $\left\{u_{n}\right\} \subset \mathcal{N}^{-}$for I. In particular, we have $c_{1}<c_{0}+S^{\infty}$.

Proof. Set $\Sigma=\left\{u \in H_{0}^{1}(\Omega):\|u\|=1\right\}$ and define the map $\Psi: \Sigma \rightarrow \mathcal{N}^{-}$given by $\Psi(u)=$ $t^{-}(u) u$. Since the continuity of $t^{-}(u)$ follows immediately from its uniqueness and extremal property, thus $\Psi$ is continuous with continuous inverse given by $\Psi^{-1}(u)=u /\|u\|$. Clearly $\mathcal{N}^{-}$ disconnecting $H_{0}^{1}(\Omega)$ is exactly two components:

$$
\begin{gather*}
U_{1}=\left\{u=0 \text { or } u:\|u\|<t^{-}\left(\frac{u}{\|u\|}\right)\right\}, \\
U_{2}=\left\{u:\|u\|>t^{-}\left(\frac{u}{\|u\|}\right)\right\}, \tag{3.36}
\end{gather*}
$$

and $\mathcal{N}^{+} \subset U_{1}$.

We will prove that there exists $t_{0}$ such that $u_{0}+t_{0} w_{k_{0}} \in U_{2}$. Denote $t_{1}=t^{-}\left(\left(u_{0}+\right.\right.$ $\left.\left.t w_{k_{0}}\right) /\left\|u_{0}+t w_{k_{0}}\right\|\right)$. Since $t^{-}\left(\left(u_{0}+t w_{k_{0}}\right) /\left\|u_{0}+t w_{k_{0}}\right\|\right)\left(\left(u_{0}+t w_{k_{0}}\right) /\left\|u_{0}+t w_{k_{0}}\right\|\right) \in \mathcal{N}^{-}$, we have

$$
\begin{equation*}
t_{1}^{2}-\frac{t_{1}^{p} \int a(x)\left|u_{0}+t w_{k_{0}}\right|^{p}}{\left\|u_{0}+t w_{k_{0}}\right\|^{p}}=\frac{t_{1}}{\left\|u_{0}+t w_{k_{0}}\right\|} \int f\left(u_{0}+t w_{k_{0}}\right) \geq 0 \tag{3.37}
\end{equation*}
$$

Thus

$$
\begin{align*}
t_{1} & \leq\left[\frac{\left\|u_{0}+t w_{k_{0}}\right\|}{\left(\int a(x)\left|u_{0}+t w_{k_{0}}\right|^{p}\right)^{1 / p}}\right]^{p /(p-2)}=\left[\frac{\left\|\left(u_{0} / t\right)+w_{k_{0}}\right\|}{\left(\int a(x)\left|\left(u_{0} / t\right)+w_{k_{0}}\right|^{p}\right)^{1 / p}}\right]^{p /(p-2)} \\
& \leq\left[\frac{\left\|\left(u_{0} / t\right)+w_{k_{0}}\right\|}{\left(\int a_{0}\left|\left(u_{0} / t\right)+w_{k_{0}}\right|^{p}\right)^{1 / p}}\right]^{p /(p-2)} \quad \text { where } a_{0}=\inf _{\Omega} a(x)>0  \tag{3.38}\\
& \longrightarrow a_{0}^{1 / p-2}\left\|w_{k_{0}}\right\|<\infty \quad \text { as } t \longrightarrow \infty .
\end{align*}
$$

Therefore, there exists $t_{2}>0$ such that $t_{1}=t^{-}\left(\left(u_{0}+t w_{k_{0}}\right) /\left\|u_{0}+t w_{k_{0}}\right\|\right)<\left\|w_{k_{0}}\right\|$, for $t \geq t_{2}$. Since $t_{0}>t_{2}+1$, then

$$
\begin{align*}
\left\|u_{0}+t_{0} w_{k_{0}}\right\|^{2} & =\left\|u_{0}\right\|^{2}+t_{0}^{2}\left\|w_{k_{0}}\right\|^{2}+2 t_{0} \int\left(\nabla u_{0} \nabla w_{k_{0}}+u_{0} w_{k_{0}}\right) \\
& =\left\|u_{0}\right\|^{2}+t_{0}^{2}\left\|w_{k_{0}}\right\|^{2}+2 t_{0} \int\left|w_{k_{0}}\right|^{p-1} u_{0}  \tag{3.39}\\
& >t_{0}^{2}\left\|w_{k_{0}}\right\|^{2}>\left\|w_{k_{0}}\right\|^{2}>t_{1}^{2}
\end{align*}
$$

hence $u_{0}+t_{0} w_{k_{0}} \in U_{2}$.
$\mathcal{N}^{-}$disconnects $H_{0}^{1}(\Omega)$ in exactly two components, so we can find an $s \in(0,1)$ such that $u_{0}+s t_{0} w_{k_{0}} \in \mathcal{N}^{-}$. Therefore $c_{1} \leq I\left(u_{0}+s t_{0} w_{k_{0}}\right)<c_{0}+S^{\infty}$, which follows from Proposition 3.6.

Analogously to the proof of Proposition 3.4, by the Ekeland variational principle we can show that there exists a $(P S)_{c_{1}}$-sequence $\left\{u_{n}\right\} \subset \mathcal{N}^{-}$for $I$.

Proposition 3.10. Assume $(a 1),(a 2),(f 1)$ and $(f 2)$ hold, then the functional I has a minimizer $u_{1} \in \mathcal{N}^{-}$which is also a critical point of I and $u_{1}>0$ for $f \geq 0, f \neq 0$.

Proof. From Propsitions 3.5 and 3.9 , we can deduce that $u_{n} \rightarrow u_{1}$ strongly in $H_{0}^{1}(\Omega)$. Consequently, $u_{1}$ is a critical point of $I, u_{1} \in \mathcal{N}^{-}$(since $\mathcal{N}^{-}$is closed) and $I\left(u_{1}\right)=c_{1}$.

By Lemma 3.1, we can choose a number $t^{-}\left(\left|u_{1}\right|\right)>0$ such that $t^{-}\left(\left|u_{1}\right|\right)\left|u_{1}\right| \in \mathcal{N}^{-}$. Since $u_{1} \in \mathcal{N}^{-}, t^{-}\left(u_{1}\right)=1$. Applying Lemma 3.1 again, we conclude that

$$
\begin{gather*}
t^{-}\left(\left|u_{1}\right|\right) \geq t_{\max }\left(\left|u_{1}\right|\right)=t_{\max }\left(u_{1}\right), \\
c_{1}=I\left(u_{1}\right)=\max _{t \geq t_{\max }\left(u_{1}\right)} I\left(t u_{1}\right) \geq I\left(t^{-}\left(\left|u_{1}\right|\right) u_{1}\right) \geq I\left(t^{-}\left(\left|u_{1}\right|\right)\left|u_{1}\right|\right) \geq c_{1} \tag{3.40}
\end{gather*}
$$

Hence $I\left(t^{-}\left(\left|u_{1}\right|\right) u_{1}\right)=c_{1}$. So we can always take $u_{1} \geq 0$. By the maximum principle for weak solutions (see Gilbarg and Trudinger [20]) we can show that if $f \geq 0, f \not \equiv 0$, then $u_{1}>0$ in $\Omega$.

## The proof of Theorem 1.1

By Propositions 3.4 and 3.10, we obtain the conclusion of Theorem 1.1.

## 4. Existence of Nodal Solution

In this section, we will study the existence of nodal solutions for problem (1.2). To this end, we need to compare some different minimization problems. Define

$$
\begin{align*}
& \mathcal{N}_{1}^{-}=\left\{u=u^{+}-u^{-} \in \mathcal{N}: u^{+} \in \mathcal{N}^{-}\right\} \\
& \mathcal{N}_{2}^{-}=\left\{u=u^{+}-u^{-} \in \mathcal{N}:-u^{-} \in \mathcal{N}^{-}\right\} \tag{4.1}
\end{align*}
$$

Here, we use notation $u^{ \pm}=\max \{ \pm u, 0\}$. Set

$$
\begin{align*}
& \beta_{1}=\inf _{u \in \mathcal{N}_{1}^{-}} I(u)  \tag{4.2}\\
& \beta_{2}=\inf _{u \in \mathcal{N}_{2}^{-}} I(u) \tag{4.3}
\end{align*}
$$

Then we have
Proposition 4.1. (a) If $\beta_{1}<c_{1}$, then the minimization problem (4.2) attains its infimum at a point which defines a sign changing critical point of $I$. (b) Analogously, if $\beta_{2}<c_{1}$ the same conclusion holds for the minimization problem (4.3).

Proof. The proof is almost the same as that in Tarantello [6, Proposition 3.1].
The above proposition would yield the conclusion for the main theorem only if the given relations between $\beta_{1}, \beta_{2}$, and $c_{1}$ could be established. While it is not clear whether or not such inequalities should hold, we will use these values to compare with another minimization problem. Namely, set

$$
\begin{equation*}
\mathcal{N}_{*}^{-}=\mathcal{N}_{1}^{-} \cap \mathcal{N}_{2}^{-}=\left\{u=u^{+}-u^{-} \in \mathcal{N}: u^{+},-u^{-} \in \mathcal{N}^{-}\right\} \subset \mathcal{N}^{-} \tag{4.4}
\end{equation*}
$$

and define

$$
\begin{equation*}
c_{2}=\inf _{u \in \mathcal{N}_{*}^{-}} I(u) \tag{4.5}
\end{equation*}
$$

It is clear that $c_{2} \geq c_{1}$. Since $I$ satisfies $(P S)_{c}$ condition only locally, we need the following upper bound for $c_{2}$. Recall that $e_{N}=(0,0, \ldots, 0,1) \in \mathbb{R}^{N}, e_{n}=(0,0, \ldots, 0,1) \in \mathbb{R}^{n}$ and $w_{k}(x)=$ $w\left(x-k e_{N}\right)$ where $k>1$ and $w$ is the ground state solution of problem (2.6).

Lemma 4.2. Assume (a1), (a3) and (f1)-(f3) hold. For any fixed $k>1$, there exist $s>0, t>0$ such that

$$
\begin{equation*}
s u_{1}-t w_{k} \in \mathcal{N}_{*}^{-} \tag{4.6}
\end{equation*}
$$

and for $k$ large,

$$
\begin{equation*}
c_{2}<\sup _{s, t \geq 0} I\left(s u_{1}-t w_{k}\right)<c_{1}+S^{\infty} \tag{4.7}
\end{equation*}
$$

Proof. To prove (4.6), it suffices to show that there exist $s>0$ and $t>0$ such that

$$
\begin{equation*}
s\left(u_{1}-t w_{k}\right)^{+} \in \mathcal{N}^{-}, \quad s\left(u_{1}-t w_{k}\right)^{-} \in \mathcal{N}^{-} \tag{4.8}
\end{equation*}
$$

To this purpose, let

$$
\begin{equation*}
t_{1}=\min _{\Omega} \frac{u_{1}}{w_{k}}, \quad t_{2}=\max _{\Omega} \frac{u_{1}}{w_{k}} . \tag{4.9}
\end{equation*}
$$

For $t \in\left(t_{1}, t_{2}\right)$, denote by $s_{+}(t)$ and $s_{-}(t)$ the positive values given by Lemma 3.1 according to which we have

$$
\begin{equation*}
s_{+}(t)\left(u_{1}-t w_{k}\right)^{+} \in \mathcal{N}^{-}, \quad-s_{-}(t)\left(u_{1}-t w_{k}\right)^{-} \in \mathcal{N}^{-} . \tag{4.10}
\end{equation*}
$$

Note that $s_{+}(t)$ and $s_{-}(t)$ are continuous with respect to $t$ satifying

$$
\begin{align*}
& \lim _{t \rightarrow t_{1}^{+}} s_{+}(t)=t^{+}\left(\left(u_{1}-t_{1} w_{k}\right)^{+}\right)<+\infty, \quad \lim _{t \rightarrow t_{2}^{-}} s_{+}(t)=+\infty \\
& \lim _{t \rightarrow t_{1}^{+}} s_{-}(t)=+\infty, \quad \lim _{t \rightarrow t_{2}^{-}} s_{-}(t)=t^{+}\left(-\left(u_{1}-t_{2} w_{k}\right)^{-}\right)<+\infty \tag{4.11}
\end{align*}
$$

Therefore, by the continuity of $s_{ \pm}(t)$, we can find $t_{0} \in\left(t_{1}, t_{2}\right)$ such that $s_{+}\left(t_{0}\right)=s_{-}\left(t_{0}\right)=s_{0}>0$. This gives (4.8) with $t=t_{0}$ and $s=s_{0}$.

To prove (4.7), we only need to estimate $I\left(s u_{1}-t w_{k}\right)$ for $s \geq 0$ and $t \geq 0$. First, it is obvious that the structure of $I$ guarantees the existence of $r_{0}>0$ (independent of $k$ large) such that $I\left(s u_{1}-t w_{k}\right) \leq c_{1}<c_{1}+S^{\infty}$, for all $s^{2}+t^{2} \geq r_{0}^{2}$. On the other hand, for $s^{2}+t^{2} \leq r_{0}^{2}$, since $I$ is continuous in $H_{0}^{1}(\Omega)$, there exists $\bar{t} \in\left(0, r_{0}\right)$ small enough such that

$$
\begin{equation*}
I\left(s u_{1}-t w_{k}\right)<I\left(u_{1}\right)+I^{\infty}(w)=c_{1}+S^{\infty}, \quad \forall s^{2}+t^{2} \leq r_{0}^{2}, t<\bar{t} \tag{4.12}
\end{equation*}
$$

At this point, we find large $k_{0} \geq 1$, such that $I\left(s u_{1}-t w_{k}\right)<c_{1}+S^{\infty}$ holds for all $s^{2}+t^{2} \leq r_{0}^{2}$ and $t \geq \bar{t}$ :

$$
\begin{align*}
I\left(s u_{1}-t w_{k}\right)= & \frac{1}{2}\left\|s u_{1}-t w_{k}\right\|^{2}-\frac{1}{p} \int a(x)\left|s u_{1}-t w_{k}\right|^{p}-\int f\left(s u_{1}-t w_{k}\right) \\
= & \left(\frac{1}{2}\left\|s u_{1}\right\|^{2}-\frac{1}{p} \int a(x)\left|s u_{1}\right|^{p}-\int f s u_{1}\right)+\left(\frac{1}{2}\left\|t w_{k}\right\|^{2}-\frac{1}{p} \int\left|t w_{k}\right|^{p}\right) \\
& -s t \int\left(\nabla u_{1} \nabla w_{k}+u_{1} w_{k}\right)-\frac{1}{p} \int\left(a(x)\left|s u_{1}-t w_{k}\right|^{p}-a(x)\left|s u_{1}\right|^{p}-\left|t w_{k}\right|^{p}\right) \\
& +\int f t w_{k} \\
= & I\left(s u_{1}\right)+I^{\infty}\left(t w_{k}\right)-s t \int u_{1} w_{k}^{p-1}+\frac{1}{p} \int a(x)\left(\left|s u_{1}\right|^{p}+\left|t w_{k}\right|^{p}-\left|s u_{1}-t w_{k}\right|^{p}\right) \\
& -\frac{1}{p} \int\left(a(x)-a^{\infty}\right)\left|t w_{k}\right|^{p}+t \int f t w_{k} . \tag{4.13}
\end{align*}
$$

By (4.13) and the following elementary inequality:

$$
\begin{equation*}
|\alpha+\beta|^{p} \geq|\alpha|^{p}+|\beta|^{p}-C_{5}\left(|\alpha|^{p-1}|\beta|+|\alpha||\beta|^{p-1}\right), \quad \forall \alpha, \beta \in \mathbb{R}, p>1 \tag{4.14}
\end{equation*}
$$

where $C_{5}$ is some positive constant, we have

$$
\begin{align*}
\sup _{s^{2}+t^{2} \leq r_{0}^{2}, s \geq 0, t \geq \bar{t}} I\left(s u_{1}-t w_{k}\right)= & \sup _{0 \leq s \leq r_{0}, \bar{t} \leq t \leq r_{0}} I\left(s u_{1}-t w_{k}\right) \\
\leq & \sup _{s \geq 0} I\left(s u_{1}\right)+\sup _{t \geq 0} I^{\infty}\left(t w_{k}\right)+\frac{\|a\|_{\infty}}{p} C_{5} r_{0}^{p-1} \int\left(u_{1}^{p-1} w_{k}+u_{1} w_{k}^{p-1}\right) \\
& -\frac{\bar{t}^{p}}{p} \int\left(a(x)-a^{\infty}\right) w_{k}^{p}+r_{0} \int f w_{k} \tag{4.15}
\end{align*}
$$

Without loss of generality, we may assume $R_{0}=\bar{R}$, and $\epsilon \in\left(0, \bar{\delta}_{0}\right)$ where $R_{0}, \bar{R}$ and $\bar{\delta}_{0}$ are given in (f3) and (a3), respectively.
(i) First, by the Hölder inequality and (2.9),

$$
\begin{align*}
\int_{\Omega_{R_{0}}} u_{1}^{p-1} w_{k} & \leq\left(\int_{\Omega_{R_{0}}} u_{1}^{p}\right)^{(p-1) / p}\left(\int_{\Omega_{R_{0}}} w_{k}^{p}\right)^{1 / p} \\
& \leq C_{6}\left(\int_{\omega} \int_{\left\{z:|z| \leq R_{0}\right\}} \phi^{p}(y) e^{-p \sqrt{1+\mu_{1}-\epsilon}\left|z+k e_{n}\right|} d y d z\right)^{1 / p}  \tag{4.16}\\
& \leq C_{7} e^{-\sqrt{1+\mu_{1}-\epsilon} k}
\end{align*}
$$

From (2.9), (2.10), and applying Lemma 3.8, there exists a $k_{1}$ such that for $k \geq k_{1}$

$$
\begin{align*}
\int_{\Omega \backslash R_{0}} u_{1}^{p-1} w_{k} & \leq C_{8} \int_{\left\{z:|z| \geq R_{0}\right\}} e^{-(p-1) \sqrt{1+\mu_{1}-\epsilon}|z|} e^{-\sqrt{1+\mu_{1}-\epsilon}\left|z+k e_{n}\right|} d z  \tag{4.17}\\
& \leq C_{9} e^{-\sqrt{1+\mu_{1}-\epsilon} k}
\end{align*}
$$

Similarly, we also obtain

$$
\begin{gather*}
\int_{\Omega_{R_{0}}} w_{k}^{p-1} u_{1} \leq C_{10} e^{-(p-1) \sqrt{1+\mu_{1}-\epsilon} k} \\
\int_{\Omega_{R_{0}}}\left|a(x)-a^{\infty}\right| w_{k}^{p} \leq C_{11} e^{-p \sqrt{1+\mu_{1}-\epsilon} k}  \tag{4.18}\\
\int_{\Omega_{R_{0}}}|f(x)| w_{k} \leq C_{12} e^{-\sqrt{1+\mu_{1}-\epsilon} k}
\end{gather*}
$$

and there exists a $k_{2} \geq k_{1}$ such that for $k \geq k_{2}$

$$
\begin{equation*}
\int_{\Omega \backslash R_{0}} w_{k}^{p-1} u_{1} \leq C_{13} e^{-\sqrt{1+\mu_{1}-\epsilon} k} \tag{4.19}
\end{equation*}
$$

(ii) Since $a(x)$ satisfies assumption (a3) and by Lemma 3.8, there exists a $k_{3} \geq k_{2}$ such that for $k \geq k_{3}$,

$$
\begin{equation*}
\int_{\Omega \backslash \Omega_{R_{0}}}\left(a(x)-a^{\infty}\right) w_{k}^{p} \geq C_{14} e^{-\sqrt{1+\mu_{1}-\bar{\delta}_{0}} k} \tag{4.20}
\end{equation*}
$$

By $(f 3)$, (2.9), and Lemma 3.8, there exists a $k_{4} \geq k_{3}$ such that for $k \geq k_{4}$,

$$
\begin{align*}
\int_{\Omega \backslash R_{0}} f w_{k} & \leq C_{10} \int_{\left\{z:|z| \geq R_{0}\right\}} e^{-\sqrt{1+\mu_{1}+\epsilon_{0}}|z|} e^{-\sqrt{1+\mu_{1}-\epsilon}\left|z+k e_{n}\right|} d z  \tag{4.21}\\
& \leq C_{11} e^{-\sqrt{1+\mu_{1}-\epsilon k}}
\end{align*}
$$

(iii) Note that the constants $C_{i}(5 \leq i \leq 11)$ in (i), (ii) are independent of $k$. Thus, by (i), (ii), $2<p<2 N /(N-2)$ and let $\epsilon=\delta_{0} / 2$, we can find a $k_{0} \geq k_{4}$ such that for $k \geq k_{0}$,

$$
\begin{equation*}
\frac{\|a\|_{\infty}}{p} C_{5} r_{0}^{p-1} \int\left(u_{1}^{p-1} w_{k}+u_{1} w_{k}^{p-1}\right)-\frac{\bar{t}^{p}}{p} \int\left(a(x)-a^{\infty}\right) w_{k}^{p}+r_{0} \int f w_{k}<0 \tag{4.22}
\end{equation*}
$$

Combining (4.15) and (4.22), we obtain that there exists a $k_{0} \geq k_{4}$ such that for $k \geq k_{0}$,

$$
\begin{equation*}
\sup _{s^{2}+t^{2} \leq r_{0}^{2}, s \geq 0, t \geq \bar{t}} I\left(s u_{1}-t w_{k}\right)<\sup _{s \geq 0} I\left(s u_{1}\right)+\sup _{t \geq 0} I^{\infty}\left(t w_{k}\right)=c_{1}+S^{\infty} . \tag{4.23}
\end{equation*}
$$

This completes the proof of Lemma 4.2.
Proposition 4.3. Assume $(a 1),(a 2),(f 1)$ and $(f 2)$ hold. If $\beta_{1} \geq c_{1}$ and $\beta_{2} \geq c_{1}$, then the minimization problem $c_{2}=\inf _{N_{*}^{-}} I(u)$ attains its infimum at $u_{2} \in \mathcal{N}_{*}^{-}$which defines a changing sign critical point of $I$.

Proof. It is obvious that $\mathcal{N}_{*}^{-}$is closed. Exactly as in the proof of [6, Proposition 3.2], by means of Ekeland's principle, we derive a $(P S)_{c_{2}}$-sequence $\left\{u_{n}\right\} \subset \Omega_{*}^{-}$for $I$. In particular, we have $0<b_{1} \leq\left\|u_{n}^{ \pm}\right\| \leq b_{2}$, for some constants $b_{1}$ and $b_{2}$. Thus, we can take a subsequence, also denoted by $\left\{u_{n}\right\}$, such that $u_{n}^{ \pm} \rightharpoonup u^{ \pm}$weakly in $H_{0}^{1}(\Omega)$. We start by showing that $u^{ \pm} \neq 0$.

Indeed, if by contradiction we assume, for instant, that $u^{+} \equiv 0$, then we can deduce that

$$
\begin{equation*}
\left\|u_{n}^{+}\right\|^{2}-\int a(x)\left|u_{n}^{+}\right|^{p}=o(1) \tag{4.24}
\end{equation*}
$$

On the other hand,

$$
\begin{equation*}
I\left(u_{n}^{+}\right)=\frac{1}{2}\left\|u_{n}^{+}\right\|^{2}-\frac{1}{p} \int a(x)\left|u_{n}^{+}\right|^{p}-\int f u_{n}^{+}=\frac{1}{2}\left\|u_{n}^{+}\right\|^{2}-\frac{1}{p} \int a(x)\left|u_{n}^{+}\right|^{p}+o(1) \tag{4.25}
\end{equation*}
$$

By (4.24) and $\left\|u_{n}^{+}\right\| \geq b_{1}>0$, we may assume that

$$
\begin{equation*}
\left\|u_{n}^{+}\right\|^{2} \longrightarrow b, \quad \int a(x)\left|u_{n}^{+}\right|^{p} \longrightarrow b \tag{4.26}
\end{equation*}
$$

Using the argument in the proof of Proposition 3.5, by (2.7), (4.24), and (4.25), we can deduce that $b \geq S^{p /(p-2)}$ and

$$
\begin{equation*}
I\left(u_{n}^{+}\right)=\left(\frac{1}{2}-\frac{1}{p}\right) b+o(1) \geq\left(\frac{1}{2}-\frac{1}{p}\right) S^{p /(p-2)}+o(1)=S^{\infty}+o(1) \tag{4.27}
\end{equation*}
$$

However, by Lemma 4.2, $I\left(u_{n}^{+}\right)=c_{2}-I\left(-u_{n}^{-}\right)+o(1) \leq c_{2}-c_{1}+o(1)$; that is, $\lim _{n \rightarrow \infty} I\left(u_{n}^{+}\right)=c_{2}-$ $c_{1}<S^{\infty}$ which contradicts (4.27). A similar argument applies to $u^{-}$. Therefore, $u_{2}=u^{+}-u^{-} \neq 0$ is a weak solution of problem (1.2) changing sign and $u_{2} \in \mathcal{N}, I\left(u_{2}\right) \geq c_{0}$.

Set $u_{n}^{+}=u^{+}+v_{n}^{+}$and $u_{n}^{-}=u^{-}+v_{n}^{-}$with $v_{n}^{ \pm} \rightharpoonup 0$ weakly in $H_{0}^{1}(\Omega)$. Note that

$$
\begin{equation*}
\left\|v_{n}^{ \pm}\right\|^{2}-\int a(x)\left|v_{n}^{ \pm}\right|^{p}=o(1) \tag{4.28}
\end{equation*}
$$

In view of Proposition 3.9 and Lemma 4.2, we also have

$$
\begin{align*}
\lim _{n \rightarrow \infty}\left(I\left(v_{n}^{+}\right)+I\left(v_{n}^{-}\right)\right) & =\lim _{n \rightarrow \infty} I\left(v_{n}\right)=\lim _{n \rightarrow \infty} I\left(u_{n}\right)-I\left(u_{2}\right)  \tag{4.29}\\
& \leq c_{2}-c_{0}<c_{1}+S^{\infty}-c_{0}<2 S^{\infty}
\end{align*}
$$

Therefore, we must have

$$
\begin{equation*}
\min \left\{\lim _{n \rightarrow \infty} I\left(v_{n}^{+}\right), \lim _{n \rightarrow \infty} I\left(-v_{n}^{-}\right)\right\}<S^{\infty} \tag{4.30}
\end{equation*}
$$

Without loss of generality, we suppose

$$
\begin{equation*}
\lim _{n \rightarrow \infty} I\left(v_{n}^{+}\right)<S^{\infty} \tag{4.31}
\end{equation*}
$$

By (4.24), we have

$$
\begin{equation*}
I\left(v_{n}^{+}\right)=\frac{1}{2}\left\|v_{n}^{+}\right\|^{2}-\frac{1}{p} \int a(x)\left|v_{n}^{+}\right|^{p}+o(1) \tag{4.32}
\end{equation*}
$$

We claim that $\lim _{n \rightarrow \infty}\left\|v_{n}^{+}\right\|^{2}=0$. Indeed, we assume $\left\{v_{n}^{+}\right\}$is bounded below, as above, (4.28) and (4.32) imply $I\left(v_{n}^{+}\right) \geq S^{\infty}+o(1)$, contradicting (4.31). In the same way, if $\lim _{n \rightarrow \infty} I\left(-v_{n}^{-}\right)<$ $S^{\infty}$, we can also prove $\lim _{n \rightarrow \infty}\left\|v_{n}^{-}\right\|^{2}=0$. Hence we have $\lim _{n \rightarrow \infty}\left\|v_{n}^{+}\right\|^{2}=0$ or $\lim _{n \rightarrow \infty}\left\|v_{n}^{-}\right\|^{2}=$ 0 ; that is, $u_{2}=u^{+}-u^{-} \in \mathcal{N}_{1}^{-}$or $u_{2}=u^{+}-u^{-} \in \mathcal{N}_{2}^{-}$. By assumptions $\beta_{1} \geq c_{1}$ and $\beta_{2} \geq c_{2}$, we conclude that $I\left(u_{2}\right) \geq c_{1}$.

If we write $u_{n}=u_{2}+w_{n}$ with $w_{n} \rightharpoonup 0$ weakly in $H_{0}^{1}(\Omega)$, we have

$$
\begin{align*}
\left\|w_{n}\right\|^{2} & -\int a(x)\left|w_{n}\right|^{p}=o(1) \\
\lim _{n \rightarrow \infty} I\left(u_{n}\right)-I\left(u_{2}\right) & =\lim _{n \rightarrow \infty}\left(\frac{1}{2}\left\|w_{n}\right\|^{2}-\frac{1}{p} \int a(x)\left|w_{n}\right|^{p}\right)  \tag{4.33}\\
& =\lim _{n \rightarrow \infty}\left(\frac{1}{2}-\frac{1}{p}\right)\left\|w_{n}\right\|^{2}
\end{align*}
$$

Furthermore, by Lemma 4.2, we have

$$
\begin{equation*}
\lim _{n \rightarrow \infty} I\left(u_{n}\right)-I\left(u_{2}\right)=c_{2}-I\left(u_{2}\right) \leq c_{2}-c_{1}<S^{\infty} \tag{4.34}
\end{equation*}
$$

We claim that $\lim _{n \rightarrow \infty}\left\|w_{n}\right\|^{2}=0$. Indeed, we assume $\left\{w_{n}\right\}$ is bounded below, as above, (4.33) imply $I\left(w_{n}\right) \geq S^{\infty}+o(1)$, contradicting (4.34). Consequently, $u_{n} \rightarrow u_{2}$ strongly in $H_{0}^{1}(\Omega)$ and $I\left(u_{2}\right)=c_{2}$.

## The Proof of Theorems 1.2-1.4

The conclusion of Theorem 1.2 follows immediately from Theorem 1.2 and Propositions 4.1 and 4.3. With the same argument, we also have that Theorems 1.3 and 1.4 hold for $\Omega=\mathbb{R}^{N}$.
